

FITBUDDY – AI FITNESS PLAN GENERATOR USING GEMINI MODELS

8. Project Demonstration Phase

The Project Demonstration Phase is the final stage, where the completed FitBuddy application is presented and its major features are demonstrated.

The demonstration begins by introducing the project title: “FitBuddy – AI Fitness Plan Generator using Gemini Models.” The purpose of the project is explained as an AI-based system that generates personalized fitness plans according to user information and feedback.

First, the application is launched using the FastAPI server. The FitBuddy home page is opened in a web browser. The user then enters the required information such as User ID, name, age, weight, fitness goal, and workout intensity.

After submitting the form, the application processes the information and communicates with the Gemini AI system. The generated 7-day workout plan is displayed on the result page. The plan contains workout information for each day.

The nutrition and recovery recommendation is then demonstrated. This shows how the application provides additional guidance along with the workout plan.

Next, the feedback functionality is demonstrated. The user enters feedback about the generated workout plan. FitBuddy retrieves the original plan and user information and sends the feedback to the AI update module.

The system then generates a complete updated 7-day workout plan based on the user's feedback. The updated plan is displayed to the user and stored in the database.

The demonstration can also show the stored user information and plans through the available user/admin view or API endpoints.

The complete demonstration flow is:

Enter User Details → Generate Workout → Display Nutrition/Recovery → Submit Feedback → Generate Updated Plan → Store Results

Finally, the project can be explained in terms of its technologies, architecture, AI integration, database usage, testing, and future improvements.

The demonstration phase proves that the major components of FitBuddy work together as an integrated AI-powered fitness planning application.
